LETTER OF TRANSMITTAL.

UNITED STATES CENSUS OFFICE,  
Washington, D. C., March 3, 1903.

SIR:

I have the honor to transmit herewith, for publication in bulletin form, tables showing the distribution of the aggregate, foreign born, and negro population for the last three decades, 1880, 1890, and 1900, by drainage basins, in accordance with elevation above sea level, by the eighteen physiographic regions, in accordance with mean annual temperature, and mean annual rainfall; tables showing the distribution of the aggregate, native born, foreign born, and negro population for 1880, 1890, and 1900 in accordance with latitude and longitude; and a table showing the aggregate population in 1900 to the nearest thousand in each square degree.

In compiling the data for these tables the boundaries of the various geographic divisions cited above were delineated on a large United States map, showing county lines, and the population of the counties and parts of counties lying within the boundaries of the divisions was ascertained. Where a county was divided between two or more divisions the population of the area in each division was carefully estimated.

The data for these tables have been prepared under my direction by Mr. C. S. Sloane, chief of the Geographer's division.

Very respectfully,

Henry Garnett

HON. WILLIAM R. MERRIAM,  
*Director of the Census.*

# GEOGRAPHICAL DISTRIBUTION OF POPULATION

---

## DISTRIBUTION OF POPULATION IN ACCORDANCE WITH DRAINAGE BASINS.

In the tables appended is given, first, the approximate area of each drainage basin in square miles, and, second, the population as aggregate, foreign born, and negro of each drainage basin in 1900, 1890, and 1880, together with the number of each element of the population to the square mile, and the per cent of increase.

The drainage areas are classified first by the two oceans and the Great Basin; second, by sections of the coast and the divisions of the Great Basin; and third, by the principal rivers, the rivers of each section of the coast being arranged under that section, and the branches of a river placed under the main river.

The primary divisions are set at the margin of the page. Under each primary division its secondary divisions are placed, being indented. Under each of these secondary divisions the tertiary divisions are placed, and so on, the subdivisions of a drainage basin being in every case indented within that of the river comprising them.

The New England coast comprises the area and population of the basins of the several rivers given beneath it, and, in addition to these, the area and population of the minor streams and of the immediate coast from the eastern border of Maine to the Hudson River.

The Middle Atlantic coast comprises the basins of the rivers given beneath it, and the basins of the minor streams and of the coast itself from the Hudson River as far as the mouth of the Potomac, including that river.

The South Atlantic coast, in like manner, comprises the country from the Potomac southward to Florida.

The Gulf of Mexico, commencing with the peninsula of Florida, embraces the coast and the whole Mississippi Valley to the mouth of the Rio Grande, including the latter.

The population of the various subdivisions was obtained by using the county as a unit, and subdividing the counties into tenths in cases where they lie partly in one basin and partly in another. Of course, in mak-

ing these divisions of counties, population and not area was considered.

The areas of the different river basins were measured approximately from maps, and were finally adjusted to suit a total land area of the United States (which had been determined with care) of 2,970,230 square miles, exclusive of Alaska and Hawaii.

The first table shows that 95.7 per cent of the total inhabitants live in the country which is drained to the Atlantic Ocean; that 53.4 per cent live in the region drained to the Gulf of Mexico; that 43.9 per cent of the entire population of the country are congregated in the drainage area of the Mississippi River; that 9.7 per cent live in the area drained to the Great Lakes; that 3.8 per cent are found on the Pacific coast; and that only 0.5 per cent live in the Great Basin. It shows, further, that the proportion living within the region drained to the Atlantic Ocean is steadily diminishing, while of this region the part drained to the Gulf of Mexico is becoming relatively more populous, as is the case, in a still more marked degree, in the Great Basin and in the region drained to the Pacific Ocean.

The second table, that describing the foreign born, shows that of the total number, 93.1 per cent live in the region drained to the Atlantic Ocean, a smaller proportion than of the aggregate population; 36.4 per cent are found in the region drained to the Gulf of Mexico, which is a much smaller proportion than of the aggregate population, while of that drained to the Great Lakes, 15 per cent, the proportion is much larger. The proportion in the region drained to the Pacific Ocean is 6.1 per cent, considerably greater than in the case of the aggregate population.

The third table, which describes the distribution of the negro population, shows that 998 out of every 1,000 negroes are found in the regions drained to the Atlantic Ocean, and that 61.4 per cent are in the lands drained to the Gulf of Mexico, the proportion in the West and on the Pacific coast being trifling.

TABLE 1.—DISTRIBUTION OF THE AGGREGATE POPULATION IN ACCORDANCE WITH DRAINAGE BASINS: 1900, 1890, AND 1880.

DRAINAGE BASINS.	Land area (square miles).	1900			1890			1880

# DISTRIBUTION OF POPULATION IN ACCORDANCE WITH ALTITUDE.

The following tables show the distribution of the aggregate, foreign born, and negro population with respect to altitude above sea level. Of the aggregate population nearly two-fifths live between 500 and 1,000 feet above the sea. This proportion is slowly diminishing, the increase going in the main to higher altitudes. Three-fourths of the inhabitants live below 1,000 feet, and more than nine-tenths below 1,500 feet. The distribution of the foreign born shows little divergence from that of the aggregate population, except in case of the lowest altitude represented—that is, below 100 feet. Here is found one-fourth of the foreign born, while nearly one-sixth of the aggregate population is found in this region. The excess in the foreign born is in the eastern coast states.

The distribution of negroes in accordance with altitude is, on the other hand, quite different. The proportion of the negroes in the low coast belt considerably exceeds that of the aggregate population, but is less than that of the foreign born, while in the area between 100 and 500 feet is found very nearly one-half the negroes, as contrasted with little more than one-fifth of the aggregate population and less than one-sixth of the foreign born. At great altitudes are found practically no negroes, hence the habitat of negroes with regard to altitude may be characterized broadly as being near sea level.

TABLE 7.—DISTRIBUTION OF THE AGGREGATE POPULATION IN ACCORDANCE WITH ALTITUDE: 1900, 1890, AND 1880.

<sup>1</sup> Does not include the area of Alaska or Hawaii.<sup>2</sup> Does not include the population of Alaska or Hawaii or 6,394 persons of negro descent in the military and naval service of the United States stationed abroad.<sup>3</sup> Does not include the population of Alaska.<sup>4</sup> Does not include the population of Alaska or Indian Territory.<sup>5</sup> Less than one-tenth of 1 per cent.<sup>6</sup> Less than 0.1.DISTRIBUTION OF POPULATION IN ACCORDANCE WITH  
PHYSIOGRAPHIC REGIONS.

For the purpose of classifying the population, the country has been divided into 18 districts or regions, differing from one another in surface, climate, drainage, and altitude. These regions are described in full in Bulletin No. 149, of the Twelfth Census, entitled "A Discussion of Area and Population," and their limits are represented on the accompanying outline map. The following tables show in each of the divisions above mentioned, the number of inhabitants, classified as aggregate, foreign born, and negro, at each of the last three censuses, namely, 1900, 1890, and 1880. They also show the numerical increase from census to census, the per cent of increase, the proportion of the population in each of the areas in question, and the density of population of each region at each of the three decades.

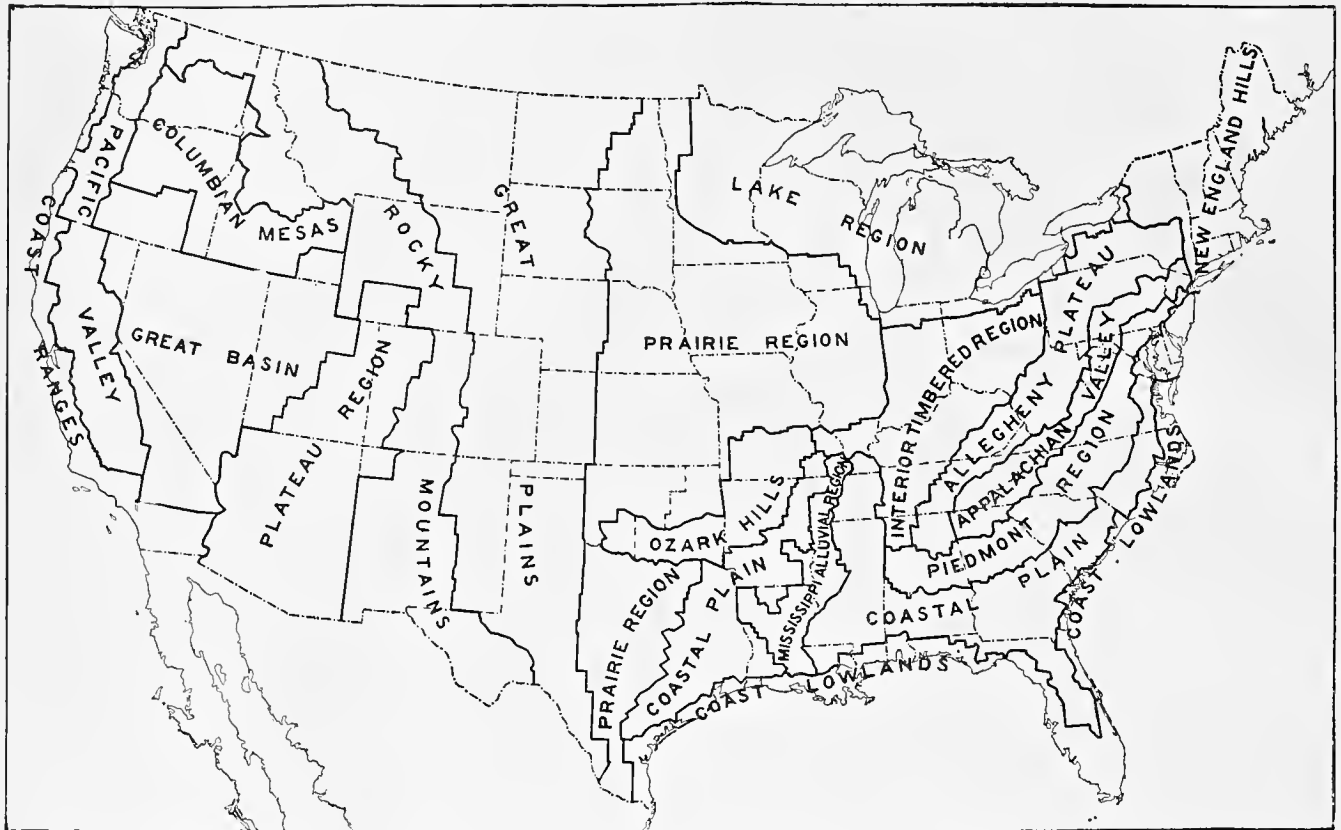

Considering the aggregate population, the most densely settled of these areas is that of New England; next to that, the Appalachian Valley and the Piedmont Region; while the most sparsely settled regions are those of the Great Plains and the Rocky Mountain country, the Plateau Region, and the Great Basin, where the rainfall is scanty and where agriculture depends upon irrigation.

The largest proportion of the aggregate population, one-sixth, is found in the Prairie Region, the granary of the country. Next to that is the New England area, containing about one-seventh, in which manufactures is the principal industry. The Lake Region follows, with one-eighth of the population, and here manufactures and the cultivation of grain are the chief industries.

The table showing the distribution of the foreign born in accordance with physiographic regions shows

marked differences from that of aggregate population. The proportion of the foreign born found in New England is far higher than in any other region; the next in order is the Lake Region where is found

nearly one-fourth of the whole foreign born element. The third in number of foreign born is the Prairie Region. In these areas are found more than two-thirds of all of the foreign born of the country.

The distribution of the negroes shows a wide divergence from that of the aggregate population and an almost complete reversal of the distribution of the foreign born, more than two-fifths being found in the

Coastal Plain, and one-fifth in the Piedmont Region. More than six out of ten of the negroes are found, therefore, in the lands east of the Appalachians and those bordering upon the Gulf coast.

TABLE 10.—DISTRIBUTION OF THE AGGREGATE POPULATION IN ACCORDANCE WITH PHYSIOGRAPHIC REGIONS: 1900, 1890, AND 1880.

DIVISIONS.	Land area (square miles).	AGGREGATE POPULATION.			INCREASE.		PER CENT OF INCREASE.		PER CENT OF TOTAL.			AGGREGATE POPULATION PER SQUARE MILE.

## DISTRIBUTION OF POPULATION IN ACCORDANCE WITH LATITUDE.

The distribution of the aggregate, native born, foreign born, and negro population, in accordance with latitude, is presented in the following tables. Of the aggregate population, the greatest proportion, one-sixth, is found between the fortieth and forty-first parallels of latitude, somewhat near the middle of the country, while between the thirty-ninth and forty-second parallels are found nearly two-fifths of the whole population, the proportion of the population diminishing northward and southward from this belt.

The distribution of the native born population is practically the same as that of the aggregate population.

The distribution of the foreign born shows features quite similar to that of the aggregate population, the greatest proportion being found in the same latitude—that is, between the fortieth and forty-first parallels—but north of this latitude the proportion is greater, and south of it, less. Taken as a whole, the foreign born tend toward higher latitudes than the aggregate population.

The distribution of the negroes is quite different, the maximum number being found between the thirty-second and thirty-third parallels of latitude, where is found nearly one-sixth of their total number; while

between the thirty-second and thirty-fifth parallels are found over two-fifths. Between the fortieth and forty-first parallels of latitude, where is found the maximum number of the aggregate population, the native born,

and the foreign born, there are but 2.7 per cent of the negroes. This illustrates the fact that the negroes as a class occupy much lower latitudes than the aggregate population or the foreign born.

TABLE 13.—DISTRIBUTION OF THE AGGREGATE POPULATION IN ACCORDANCE WITH LATITUDE: 1900, 1890, AND 1880.

## DISTRIBUTION OF POPULATION IN ACCORDANCE WITH LONGITUDE.

The distribution of the aggregate, native born, foreign born, and negro population in accordance with longitude is presented in the following tables. The greatest proportion of the aggregate population and of the foreign born population between any two meridians is found between the seventy-third and seventy-fourth meridians, comprising the larger portion of New York city; the greatest proportion of the native born is found between the eighty-seventh and eighty-eighth meridians, which include the city of Chicago; and the greatest proportion of the negroes is found between the ninetieth and ninety-first meridians, including the cities of St. Louis, Memphis, Vicksburg, and New Orleans.

The ninety-sixth meridian divides the country geographically into two nearly equal parts, but the population east of this line, 66,499,000, is seven times as great as that west of the line, 9,498,000. If both sections were populated equally, the total population of the United States, exclusive of Alaska, Hawaii, and the insular possessions, would be nearly 133,000,000, a density of population of about 45 persons to the square mile, approximately the same as that of the states of Missouri and South Carolina, and less than that of 16 other states.

TABLE 17.—DISTRIBUTION OF THE AGGREGATE POPULATION IN ACCORDANCE WITH LONGITUDE: 1900, 1890, AND 1880.

## DISTRIBUTION OF THE AGGREGATE POPULATION BY SQUARE DEGREES.

Table 21 shows to the nearest thousand the distribution of the aggregate population of the United States in 1900 (exclusive of Alaska and Hawaii), by square degrees, that is, the population included between two consecutive parallels and two meridians, and is practically a map, from which an approximation of the density of population can easily be made.

The sparseness of population of the arid region is clearly indicated, and the great centers of population, like New York, Chicago, Philadelphia, and other large cities, can readily be located.

## DISTRIBUTION OF POPULATION IN ACCORDANCE WITH MEAN ANNUAL TEMPERATURE.

The distribution of population and its elements in accordance with mean annual temperature is represented in the following tables. Of the aggregate population, three-fifths are found to be living under temperatures ranging from 45° to 55°, the proportion within these temperatures having slightly diminished within the past ten years. Between 45° and 65° are found more than four-fifths of the population. The proportion of population has increased in the extreme temperatures; that is, below 40° and above 70°.

The foreign born are found to be living under colder average conditions than the aggregate population, and the negroes under much warmer conditions. Of the

former more than three-fourths are found between 45° and 55°, and more than seven-eighths between 40° and 55°, more than one-half being found between 45° and 50°. The drift of the foreign born is toward lower temperature, as is shown by the general increase in proportion in those regions.

The negroes are found in greatest proportion in those regions where the annual temperature is between 60° and 65°, while between 55° and 70° are found nearly 84 per cent of all the negroes. The drift of the negroes is plainly away from the lower temperatures and toward the higher.

## DISTRIBUTION OF POPULATION IN ACCORDANCE WITH MEAN ANNUAL RAINFALL.

The following tables show the distribution of the aggregate, foreign born, and negro population, in accordance with mean annual rainfall. Of the aggregate population, nearly two-fifths are found in the region where the rainfall averages from 40 to 50 inches, and nearly one-third where it averages 30 to 40 inches. Not less than three-fourths of all the population are found within regions of sufficient rainfall. Where the rainfall is less than 20 inches, which marks the line of lowest limit of successful agriculture without irrigation, there are found but 3.4 per cent of the aggregate population.

The foreign born are distributed in much the same manner, except that the proportion is greater in the regions of average and scanty rainfall, and less in those of abundant rainfall. The negroes, on the other hand, are found in their greatest numbers where the rainfall is between 50 and 60 inches. Here are found more than three-fifths of the total number. In those regions in which the rainfall ranges from 40 to 60 inches are found more than nine-tenths of all the negroes of the country, showing that the negroes affect regions of heavy rainfall.

TABLE 25.—DISTRIBUTION OF THE AGGREGATE POPULATION IN ACCORDANCE WITH MEAN ANNUAL RAINFALL: 1900, 1890, AND 1880.
